Profile Summary

Dynamic Embedded Software Engineer with a proven track record of driving innovation and excellence in the field of embedded systems. Currently, I am contributing my expertise to Rezler Systems, where I am involved in designing and implementing cutting-edge solutions for diverse applications. With a strong foundation in Electrical Engineering and specialized experience in embedded software development, I thrive on tackling complex challenges and delivering high-quality solutions. My role entails collaborating closely with cross-functional teams to conceptualize, develop, and deploy embedded software solutions that meet stringent performance and reliability requirements.

Education

B.Tech/B.E. - Bachelor of Technology / Engineering, 2021

Gondwana University, Gadchiroli

12th, 2017

Maharashtra, Hindi

10th, 2015

Maharashtra, Hindi

Work Experience

Apr 2024 - Present

Embedded Software Engineer Lead

Rezler system private limited

Key Responsibilities: Leadership and Team Management: Lead, mentor, and manage a team of embedded software engineers. Foster a collaborative and high-performance culture within the team. Conduct regular performance evaluations and provide constructive feedback. Project Management: Oversee the planning, execution, and delivery of embedded software projects. Define project scope, objectives, and deliverables in collaboration with stakeholders. Ensure projects are completed on time, within scope, and within budget. Technical Expertise: Design, develop, and optimize embedded software systems. Ensure compliance with coding standards, best practices, and security guidelines. Troubleshoot and resolve complex technical issues. Innovation and Continuous Improvement: Stay updated with the latest industry trends and technologies. Drive continuous improvement initiatives to enhance software development processes. Evaluate and implement new tools and technologies to improve efficiency and quality. Collaboration and Communication: Collaborate with cross-functional teams including hardware engineers, product managers, and

Jun 2023 - Mar 2024

Stem Trainer

Drobozone

Create engaging and comprehensive STEM curricula for various age groups, ensuring alignment with educational standards and objectives. Regularly update curriculum materials to reflect advancements in STEM fields Implement effective classroom management techniques to ensure an optimal learning experience. Encourage teamwork and collaboration among students during practical sessions

Dec 2022 - May 2023

Intern

Rubixe

During my internship at RUBIXE in Bangalore, I had the opportunity to dive into the exciting world of data science. RUBIXE is a dynamic and innovative company that provided a perfect environment for hands-on learning and growth in the field. Key Highlights: 1. Data Analysis and Visualization: I actively contributed to conducting data analysis and visualization, helping transform raw data into actionable insights. This involved exploring and interpreting data patterns to support informed decision-making. 2. Stakeholder Collaboration: My role involved close collaboration with stakeholders to understand their specific requirements and translate them into analysis tasks. This interaction allowed me to bridge the gap between technical data work and practical business applications. 3. Project Management: I was responsible for developing project plans and ensuring that data processes were scaled efficiently. Meeting project deadlines was a priority, and I consistently delivered reports that met the defined timelines. 4. Problem Solving: Throughout my internship, I focused on identifying root causes of business problems and executed data analysis to uncover opportunities for improvement. My problem-solving skills were put to the test in this dynamic environment. My time at RUBIXE was a valuable experience that honed my data science skills, expanded my practical knowledge, and allowed me to contribute to real-world projects. I am grateful for the opportunity to have worked with a forward-thinking company like RUBIXE, and I look forward to applying the skills I acquired in my future endeavors.

Internship

31 Days

Maharashtra State Power Generation Company (MAHAGENCO)

Key Responsibilities and Contributions: Assisted in various activities related to the operation and maintenance of thermal power plants. Participated in regular inspections of power plant equipment, including boilers, turbines, generators, and auxiliary systems. Monitored and analyzed plant performance parameters, such as heat rate, efficiency, and emissions, to identify areas for improvement. Assisted in conducting routine maintenance tasks, troubleshooting operational issues, and implementing corrective measures. Worked closely with the engineering team to identify potential energy-saving opportunities and recommend optimization strategies. Conducted research on new technologies and best practices in the field of thermal power generation. Prepared reports and presentations to document project progress, findings, and recommendations for management.

Projects

541 Days

Translation device

working on a like transaltion device uses edge ai two way communication

0 Days

Face Detection Using Raspberry pi

Created a project for live face recognition system for 1. Face idenctification 2. Live attandace system 3. Door Lock etc Used open cv and harcascade tools for buidilng this modle

Employee perfonamce prediction

Introduction Employee performance prediction is a critical task for organizations to enhance productivity and job satisfaction. This project analyzes the factors affecting employee performance and builds predictive models using machine learning techniques. Data Overview Data Source: The dataset used for this analysis contains 1200 rows and 28 columns. It includes both quantitative and qualitative features, such as employee demographics, work-related factors, and performance ratings. Some key insights from the analysis include: Age and total work experience tend to be positively correlated with higher performance ratings. The department and job role of employees have an impact on performance ratings. Employee satisfaction, job involvement, and salary hike percentages are important factors affecting performance. The number of training sessions and work-life balance also influence performance.

31 Days

Rice-leaf-disease-prediction-using-CNN

This project is aimed at developing a model for classifying three major diseases that attack rice plants: leaf blast, bacterial blight, and brown spot. The main objectives are to prepare a comprehensive data analysis report, create a classification model, and analyze data augmentation techniques. Model Architecture A Convolutional Neural Network (CNN) is used for image classification. Preprocessing layers include resizing images to 256x256 pixels, rescaling pixel values to [0, 1], and data augmentation techniques like random flips and rotations. Convolutional layers, dropout layers to prevent overfitting, and a flattening layer for 1D data transformation. Based on the project's findings: The initial model exhibited overfitting issues. With training, the model started to generalize better after introducing dropout layers. The final model achieved an accuracy of approximately 90.91% on the training dataset and 87.5% on the test dataset.

243 Days

SELF DRVING ELECTRICAL CAR

The self-driving car project aimed to develop a prototype capable of autonomously navigating roads by leveraging an image recognition system. Key features included road lane following, traffic signal detection, overtaking in front vehicles, and object detection. Implemented in Python, the project utilized image processing techniques and computer vision algorithms. OpenCV library facilitated tasks like lane detection and object recognition. Deep learning models, such as Convolutional Neural Networks (CNNs), were trained on large datasets for accurate object detection. Throughout the project, we overcame challenges related to real-time processing, lighting conditions, and complex road scenarios. The prototype was thoroughly tested to ensure reliability. This project honed my skills in computer vision, image processing, and deep learning. My leadership contributed to successful project completion and a functional self-driving car prototype.

184 Days

WIRELESS CHARGING OF AN ELECTRIC VEHILCE

The project aimed to develop a wireless charging system for electric vehicles (EVs), providing a convenient and efficient charging solution. The system utilized inductive power transfer and pulse width modulation (PWM) technology to transmit energy wirelessly from a charging pad to the EV. Benefits: Convenience: Wireless charging eliminates the need for physical connections, offering a convenient and user-friendly charging experience. Efficiency: Optimized design and control mechanisms improve charging efficiency, reducing energy losses during power transfer. Future Applications: Findings from the project can support broader applications in public charging infrastructure and smart city initiatives, promoting the wider adoption of EVs. The wireless charging project demonstrated the feasibility and advantages of wireless charging technology for EVs. It addressed the need for convenient and efficient charging solutions, contributing to sustainable transportation and the growing EV indust
